

ABSTRACT

The invention relates to a dyeing or washing installation (1) for narrow textile fabric (2), the narrow fabric (2) being passed through a dyeing or washing liquor, followed by removal of the excess amount. To develop further a dyeing or washing installation (1) of the type in question advantageously with regard to the application of dye and removal of excess amounts, it is proposed that the narrow fabric (2) is guided along a width-adapted suction nozzle (6), disposed downstream of the dyeing or washing liquor.
